Above: Thousands of shad fry were released into the Charles River by biologists from the MA-Division of Marine Fisheries and U.S. Fish & Wildlife Service. A donation to the CWRP from **Polaroid** and **Battelle** helped purchase field supplies. The Charles River is the primary target for restoration of shad in Massachusetts due to the availability of spawning and rearing habitat, functioning fishways suitable for shad, and the historical significance of shad in the system. Partners aim to restore a population of 30,000 shad over five years.

Right: The **ERM Foundation** awarded funds to CWRP for remote sensing equipment to monitor tides in the Green Harbor River salt marsh. The data will assist the Town of Marshfield in managing a tide-gate to achieve wetland restoration. The **UMASS-Boston Center for Environmental Sensing Networks** provided technical assistance to CZM for the installation of the telemetry device that posts data by wireless technology to a web site.
